

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A drive device for a door, comprising:

~~a guide device, comprising a rail, extending in a movement direction of the door, the guide rail having opposed first and second ends;~~

~~a carriage adapted to move along said guide device rail, and comprising an electric motor, to cause movement of a door leaf, and further comprising a current feed connecting the electric motor with a current source, the current of which is supplied at one end of the guide device rail;~~

~~wherein said current feed comprises a first insert body to be plugged into an end of the guide device and a connecting cable, said first insert body configured and dimensioned to be interchangeably plugged into the first end of the guide rail and the second end of the guide rail current feed being arranged to be capable of being used at either end of said guide device.~~

2. (Currently Amended) The drive device according to claim 1, further comprising:

~~a second insert body without a connecting cable, said second insert body having a form corresponding to that of said first insert body so as to be interchangeably plugged into the first end of the guide rail and the second end of the guide rail an end of the guide device into which said first insert body is not plugged.~~

3. (Currently Amended) The drive device according to claim [[1]] 2, wherein the current feed ~~means~~ comprises said guide rail and a traction means, the traction means to be connected at one end of said guide rail with a connecting cable using a traction means tightening device, and wherein the first insert body further comprises a contact body to contact said guide rail.

4. (Currently Amended) The drive device according to claim 3, wherein at least one of the group consisting of the first insert body and the second insert body comprises:

~~a first part to carry the traction means tightening device; and~~

~~a second part to provide an encircling abutment for an end of said guide rail.~~

5. (Previously Presented) The drive device according to claim 4, wherein the first part and

the second part are integrally connected together.

6. (Currently Amended) The drive device according to claim 4, wherein the second part has bores to be used for fastening said guide rail.

7. (Currently Amended) A drive device for a door, comprising:

a guide device rail extending in a movement direction of the door and having two opposed first and second ends;

a carriage that moves along the guide device rail and comprising comprises an electric motor for causing movement of a door leaf[[,]]; –further comprising

a current feed to connect the electric motor with a current source, wherein the current feed comprises a traction mechanism and a first insert body configured and dimensioned to be interchangeably to be plugged into the first end of the guide rail and the second end of the guide device rail, wherein the first insert body includes a traction mechanism tensioning device with a positive interlocking part to lock in place the traction mechanism.

8. (Cancelled)

9. (Currently Amended) The drive device according to claim [[8]] 7, further comprising a second insert body having a traction mechanism tensioning device with a positive interlocking part to lock into place the traction mechanism.

10. (Currently Amended) The drive device according to claim 9, wherein the traction mechanism is tensioned between the traction mechanism tensioning devices of the first and second insert bodies at the ends of the guide device rail.

11. (Previously Presented) The drive device according to claim 7, wherein the traction mechanism comprises a chain.

12. (Previously Presented) The drive device according to claim 7, wherein the positive interlocking part for at least one of the traction mechanism tensioning devices is bayonet shaped.
13. (Currently Amended) The drive device according to claim 7, wherein the positive interlocking part of at least one of the traction mechanism tensioning ~~means~~ devices comprises a hook.
14. (Currently Amended) The drive device according to claim [[7]] 9, wherein the guide ~~device~~ comprises a guide rail that forms a component of the current feed.
15. (Currently Amended) The drive device according to claim 14, wherein at least one of said first and second insert bodies comprises:
 - a first part to carry the traction mechanism tensioning device; and
 - a second part to form an end stop at an end of the guide rail, the second part having an opening to permit accessing an adjustment device of the traction mechanism tensioning device.
16. (Previously Presented) The drive device according to claim 15, wherein said adjustment device enables the positive interlocking part of the traction mechanism tensioning device to be adjusted in a longitudinal direction of the guide rail.

17. (Previously Presented) The drive device according to claim 14, wherein the first insert body further comprises:

a connecting cable; and

one or more contact elements to make contact with the guide rail.

18. (Previously Presented) The drive device according to claim 17, wherein the traction mechanism tensioning device and the traction mechanism are connected to a first lead of the connecting cable.

19. (Cancelled)

20. (Previously Presented) The drive device according to claim 17, wherein at least one said contact element is connected to a second lead of the connecting cable.
